PEEP is routinely used in mechanical ventilation to prevent collapse of distal alveoli, and to promote recruitment of collapsed alveoli ; How to optimise PEEP is a controversial topic, but should involve (1) optimisation of oxygenation and (2) minimisation of ventilator induced lung injury (VILI), and should be individualised for a given patient “High” PEEP is used as part of an

One trial of children (mostly with malaria) in Africa, in a setting where escalation to mechanical ventilation and other organ support was limited, questioned this practice . We believe that the extrapolation of these data to patients in better-resourced settings is not valid and thus recommend that clinicians restore euvolemia with IV fluids, more urgently initially, and then more cautiously

Tracheostomy is an operative procedure that creates a surgical airway in the cervical trachea. [1, 2] It is most often performed in patients who have had difficulty weaning off a ventilator, followed by those who have suffered trauma or a catastrophic neurologic insult. [] Infectious and neoplastic processes are less common in diseases that require a surgical airway.

Ventilation improves visibility and reduces the chance of flashover or backdraft. 19 The ventilation opening may produce a chimney effect causing air movement from within a structure toward the opening. This air movement helps facilitate the venting of smoke, hot gases and products of combustion, but may also cause the fire to grow in intensity and may endanger fire fighters who are between

Intubation, with subsequent mechanical ventilation, is a common life-saving intervention in the emergency department (ED). Given the increasing length of stay of ventilated patients in EDs, it is necessary for emergency practitioners to have a good understanding of techniques to optimize mechanical ventilation and minimize complications.

Biphasic cuirass ventilation is a form of non-invasive mechanical ventilation that can in many cases allow patients an alternative mode of respiratory support, allowing patients to avoid an invasive tracheostomy and its many complications. While this method has not been proven to help in every case, it has been shown to be an effective alternative for many.

The parents eventually requested withdrawal of mechanical ventilation and extubation. Once extubated, aggressive use of baclofen, benzodiazepines, narcotics, and barbiturates was continued to control the muscle spasms and respiratory obstruction with good effect initially but without effect once his gasping respiratory pattern started. During this gasping phase, the patient was unresponsive

Il polmone d'acciaio, conosciuto anche come cisterna di Drinker e Shaw, fu sviluppato nel 1929 e fu una delle prime macchine a pressione negativa per la ventilazione artificiale a lungo termine. Fu poi perfezionato e utilizzato ampiamente nel ventesimo secolo per le epidemie di poliomielite, che afflissero il pianeta negli anni quaranta. Si tratta effettivamente di una sorta di cisterna, nella
